If you are on Uplay, click on the title and you will see an option to . What's the release date for call of duty 4? The multiplayer campaign, indeed, the previous installment, was COD4, another installment is ready to come. The community now is .Q: Python Dict Comprehension: how does list comprehension work? #just a simple math problem import random a=[] for x in range(10): a.append(random.randint(0,1)) print(a) result: [0,1,0,1,0,1,0,1,0,1] I have the same problem in python list comprehension. I cannot understand how this works. I understand the method of using for loop to generate random numbers but I do not know how I can generate random numbers from 0 to 1, for each set of pairs. Here is my attempted list comprehension: a = [list(item) for item in [random.randrange(0,2) for _ in xrange(4)]] print a Result: [None, None, None, None] I have no idea why this code is not executing. How to I get this to work? A: The list comprehension is exactly equivalent to this code: b = [random.randrange(0, 2) for _ in xrange(4)] a = [list(item) for item in b] If you replace your list with that the output will be the same. What you are trying to do with the list comprehension is the following: a = [list(random.randrange(0, 2)) for _ in xrange(4)] Generate the same thing, but instead of assigning that back to a list, store the items in an individual list. You are trying to create a list of lists. You can't do that with a list comprehension. It is just not possible to create something like a = [l1, l2, l3]. You would have to use the same list four times instead of creating four independent lists. /* 82138339de
