This invention relates to a microprocessor-based apparatus and method for performing a plurality of different tasks on data items, the tasks related to a universal file format such as the Open Sound Control (OSC) standard format. Aims of the OSC format are: 1. to be backwards compatible with existing OSC devices so that they can continue to communicate with the computer 2. to be free for all to use. OSC is designed around the concept of "Remote Events". The remote events are the actual events broadcast from the master to one or more slave devices. These events are represented in OSC in the form of an OSC message. A remote event is either a single note (1) or a group of notes (2) with information related to the event. The OSC message is divided into a header (Header) and a footer (Footer). The header has information which is common to all messages. It contains the name of the device it is destined for, the type of event it contains, the number of the event, the sequence number of the event in this message and the timestamp of the event. The footer contains the name of the device it is destined for, the type of event, the name of the event and its sample number. The OSC message format is comprised of three parts, namely the header, the footer and the event. It is the event format which is the most complex and important to understand. Currently there are several editors and viewers designed specifically to cater to the needs of musicians. One such file format is the popular MIDI format. MIDI (Musical Instrument Digital Interface) is a standard protocol for the exchange of music information between electronic musical instruments or between a musical instrument and a sequencer. MIDI was adopted by the American National Standards Institute in 1981. The MIDI Standard defines a basic protocol for a musical instrument digital interface for communication between audio devices. 3e33713323
